

BENCHMARK REPORT · JUNE 8, 2026

The state of product recommendation quizzes

2026 benchmark report

1 in 18 shoppers who finish a product recommendation quiz place an order, 2.75x a typical online store. This report breaks down which categories convert highest, how much more quiz shoppers spend, and how long a single quiz keeps paying. Based on real data from 45M+ quiz responses across 20,000+ ecommerce stores. Aggregate and anonymized.

The headline numbers

5.5%

of shoppers who finish a quiz place an order (about 1 in 18)

+11-15%

higher average order value, within the same store

69%

of shoppers who start a quiz finish it

1 in 5

quiz-attributed orders land 30+ days later

Conversion by category

Consumable and replenishable categories convert two to three times higher than the average online store. High-ticket and high-consideration purchases convert an order of magnitude lower: the quiz drives discovery there, but the sale lands later, off-session, or not at all.

CATEGORY	CONVERSION	QUIZ CONVERSION BOOST	RESPONSES
Fragrance	6.9%	345%	3,989
Haircare	6.7%	335%	7,980
Supplements & health	6.2%	310%	1,046
Beauty & skincare	6.1%	305%	16,225
Coffee & tea	5%	250%	1,725
CBD	4.3%	215%	719
Other sectors	~3.6%	~180%	4,500
All quiz categories (pooled)	5.5%	275%	all

Everything outside the named categories, including generic and higher-consideration quizzes. Measured at about 3.6%, around 180% of a typical store.

Do quiz shoppers spend more?

Measured within the same store, quiz orders run 11% to 15% larger than non-quiz orders, and that holds in 68% to 74% of stores. Strongest where the quiz can build a set or routine, close to flat where the purchase is a single item.

CATEGORY	WITHIN-STORE AOV UPLIFT	STORES WITH A LIFT
Beauty & skincare	+20%	80%
Haircare	+14%	82%
Supplements & health	+14%	n/a
Fragrance	Flat	n/a
Coffee & tea	Flat	n/a
Other sectors	+10%	65%

Currency-robust and store-mix-controlled. Triangulated across three independent samples at +11%, +15% and +14% median.

A quiz keeps paying after the session

67% of first quiz-attributed orders happen the same day, 88% within 7 days, 91% within 30 days. But about 1 in 5 of all quiz-attributed orders land more than 30 days after the quiz. The quiz segments the shopper, and that segmentation keeps converting for months.

What counts as "the average store"

There is no single true number for ecommerce conversion. The honest range is roughly 1.6% to 2.9%. We benchmark against a round 2%, which puts quiz takers at about 2.75x the average store.

SOURCE	AVERAGE CONVERSION	SCOPE
Statista	1.6%	Global, 2025
IRP Commerce	1.7-1.8%	UK/IE live merchant data, 2025
Dynamic Yield	2.66%	400+ mid-to-large brands, 2025
Shopify	2-3%	Shopify's own published guidance

Our 5.5% is a quiz-taker rate (orders per completed quiz); every figure above is a site-wide rate (orders per visitor). Quiz takers are self-selected, so part of the gap is the funnel, not just the quiz.

Methodology

- Source: RevenueHunt's own platform, across every ecommerce platform we support. Aggregate and anonymized: no individual store is identifiable, and our own demo stores are excluded everywhere.
- Conversion is a quiz-taker rate: orders attributed to a quiz response, divided by completed quizzes. It is not a site-wide rate. Quiz takers are self-selected and more engaged than the average visitor, so this is not a like-for-like comparison to a store's overall conversion rate. We say so wherever we make the comparison.
- Category is derived from the merchant-authored quiz name (for example "Skincare quiz", "Dog food quiz"). About 78% of responses come from generic or unnamed quizzes and are excluded from every per-category figure.
- Average order value uplift is measured within-store: the same store's median quiz order value against its median non-quiz order value. This is currency-robust and removes the store-mix bias that washes the effect out in a naive platform-wide average.
- Every conversion figure is a floor. Attribution is still attaching as merchants sync orders (9% of first orders land more than 30 days after the quiz), and cross-device or untracked orders never attach at all. The real numbers are higher, not lower.
